

MINH NGUYEN

Product-minded Frontend / Full-Stack Engineer

React · Next.js · TypeScript · Node.js

Relocating to Hanoi, Vietnam - available from mid-October 2026 • +33 6 18 67 03 04 • minhstrasbourg@gmail.com

nguyen-minh.dev • github.com/minhouuuuuu • linkedin.com/in/nguyen-minh-dev

Full-stack engineer with 4 years of production experience in France - two apprenticeships, ~60 client projects - now moving back to Hanoi. I came to code from UI/UX design, so I start from the user's real blocker, argue the scope with the people paying for it, and own what I choose not to build. React, Next.js and TypeScript on the front, Node.js/NestJS and REST APIs on the back. I take features end to end - framing, implementation, tests, deployment, production monitoring - and I write down the trade-offs, including the ones I got wrong. Native Vietnamese, professional English, fluent French.

SKILLS

Front-end: React (since 2022), Next.js (App Router, RSC), TypeScript, JavaScript (ES6+), HTML5, CSS3/SASS, Tailwind CSS, jQuery, Vue.js (shipped to production), responsive UI, design systems, accessibility

Back-end & data: Node.js (NestJS, Express), REST APIs shipped to production, PostgreSQL/SQL, Firebase/Firestore, Supabase, Sanity (GROQ), Clerk, batch data pipelines with deduplication and resumable jobs, server-side auth, PHP 8.2, WordPress/ACF

Product & framing: stakeholder mapping, requirements analysis with business stakeholders, personas, risk register, MoSCoW scoping, workload and cost estimation, scope arbitration, content and data modelling, decision records

Testing, delivery & operations: Vitest, unit and integration tests, security-rule testing validated by deliberately breaking rules, validation plans and acceptance testing, GitHub Actions CI, Linux servers, Nginx, health probes with 200/503 contract, alerting chain verified under simulated outage, incident logging, release notes; Docker (Master's projects)

Interactive & graphics: Three.js / WebGPU (TSL, compute shaders), GLSL, Canvas 2D, GSAP, Framer Motion, Lenis

Tools & ways of working: Git/GitHub, Jira, Linear, Confluence/Notion, Figma, Agile; AI coding tools (Claude Code) with critical review

Languages: Vietnamese (native); English (professional working proficiency - 2 years of daily technical collaboration with a Dutch engineering team); French (fluent - 8 years living and working in France)

PROFESSIONAL EXPERIENCE

Creative Front-End Developer (Apprenticeship, 2 yrs) | Izhak Interact Agency, Strasbourg, France Sept 2024 - Sept 2026

- Owned 9 sites from scratch to production across ~60 client projects - including the content model each client would live with for years: which blocks stay fixed, which become editable, and which fields stay global so changing one sentence does not mean editing ten pages.
- Cut project setup cost over two years by deciding the data model before writing code: my first site needed a full content-model rebuild four months after launch; my last had its architecture set in two days and never revisited - same conditions, no specification either time.
- Drew the line on what non-technical clients can and cannot do: a custom rich-text field without media upload, and a client-administrator role stripped of plugin, theme and user-management rights via `map_meta_cap` - full control of content, no way to break the site.
- Built a data-import plugin turning 50,000+ denormalised CSV rows into 2,250 linked dealer records: batch processing driven by a self-rescheduling cron under a 40-second budget, state carried between runs, two-level deduplication on the client external key, product matching by normalised prefix, and geocoding that never overwrites an existing coordinate.
- Deleted 1,501 lines of my own API integration 13 days after shipping it, and went back to a manual import: the automated path traded a simple human dependency for a fragile technical one on a third party we did not control. The robust part - batching, deduplication, geocoding - stayed.
- Designed a non-intrusive animation layer as custom web components - used 90+ times across 32 templates - where each element tears down its own animations on disconnect, which is what makes page transitions without reload viable instead of leaking listeners and RAF loops.
- Rewrote a cursor-following effect from a mousemove handler writing to the DOM on every event into a `requestAnimationFrame` loop with damped interpolation, decoupling event frequency from render frequency. Stack: WordPress/ACF, PHP 8.2, TypeScript, Tailwind, GSAP, jQuery.

Full-Stack Engineer (Intern) | Viettel Network, Hanoi, Vietnam Apr - May 2024

- 2-month international mobility programme arranged by my school during my apprenticeship. Built internal tooling used by 5,000 employees at one of Vietnam's largest telecom operators (Vue.js + NestJS), inside a cross-functional team of 20 engineers.
- Designed the data layer for network-operations dashboards: 20 REST endpoints aggregating 20,000+ daily data points into readable views, with shared loading and error states.
- Built a device-registration form with local persistence, validated on both sides - Vuelidate on the client, class-validator on the NestJS server - and cut the storage footprint by persisting identifiers only and re-fetching details on demand.
- Onboarded onto an entirely unfamiliar stack in weeks with no access to Google or any external resource (security policy), working from internal documentation and pair programming alone.

Front-End Developer & Test Engineer (Apprenticeship, 2 yrs) | BDR Thermea France Sept 2022 - July 2024

- Co-organised a 5-day Design Sprint with 6 cross-functional stakeholders: framed the real need of field installers, prioritised the critical path and deliberately cut requested features - the leaner prototype was the one approved for production.
- Evaluated four technical solutions against explicit criteria (technical means, in-house skills, budget, lead time, coverage) and produced the comparison that led management to its decision.

- Migrated an internal heat-pump diagnostics portal from a flat HTML/CSS/JS prototype to a modular React architecture after judging the original unmaintainable - designed the 17-screen interface first, then implemented it.
- Worked around the absence of any available server by provisioning a Raspberry Pi end to end - Raspbian, Node/npm, and an Nginx configuration serving the React build - unblocking the demo to management.
- Wrote validation plans, test reports and defect tickets in English for two years, working daily with the development team in the Netherlands - including a validation plan built from scratch for a 10-year-old installer tool that had neither plan nor specification, deriving expected behaviour from a heat-pump simulation bench.

Web Developer & Webmaster (Freelance) | Hasu No Hana, Remote (Hanoi, Vietnam)

Dec 2023 - May 2024

- Sole developer: built and maintained a company website end to end (WordPress, PHP, custom theme), with performance tuning (95 Lighthouse) and SEO work that grew organic traffic by 20% in 3 months.

SELECTED PROJECTS

Askar Horse Riding Tours askar-site.vercel.app · Live site for a Kyrgyz family tour operator · Next.js 16 · React 19 · Sanity · TypeScript

- Framed the project before building it: stakeholder map, personas, SWOT, 9 risks rated by criticality, MoSCoW scope, 36 man-days estimated with budget, and a C4 architecture - for a family business losing 40-60% of each booking to intermediary platforms.
- Decided against online payment: the real blocker for a \$2,000 trek in Kyrgyzstan is trust, not checkout friction - so booking runs through WhatsApp, where the family already answers, instead of a payment integration nobody would have used.
- Built a content layer that degrades field by field instead of failing whole: every CMS string falls back to bundled JSON and every locale falls back to English, so a half-published CMS still renders a complete page in all 11 languages.
- Designed a typed translation registry whose shape is derived from the English source, turning a missing key in any of 11 locales into a build error rather than a blank string in production - across 349 keys and 3,839 localized strings.
- Architected the CMS read path as a single aggregated GROQ projection resolved once in the root layout, so 11 language dictionaries are built from one network round-trip instead of one request per section.
- Kept pricing in versioned code rather than in the CMS, accepting that the client must call me for a price change in exchange for four currencies never drifting out of sync - a trade-off I would now revisit, since it leaves the project's highest-rated risk unmitigated.

FileDrop github.com/minhouuuuuu/dropbox-clone · picked up from a training project, then secured and operated · Next.js · TypeScript · Firebase

- Diagnosed and fixed a cross-tenant data leak in my own code, where Firebase security rules required an identity the app never supplied - built a server-side Clerk-to-Firebase token bridge mapping the session to the Firebase uid, making ownership rules enforceable with zero data migration.
- Proved the fix instead of asserting it: wrote 7 Firestore isolation tests against the emulator and validated them by deliberately breaking the ownership rule, watching 5 of 7 turn red before restoring it - a security test never seen failing proves nothing.
- Built health monitoring over the three dependencies whose failure makes the product unusable - config, identity-token signing, storage - with a 200/503 contract, per-dependency timeouts and threshold logic extracted into pure functions covered by 16 of the suite's 42 tests.
- Instrumented an alerting chain and verified it end to end by pulling the Firebase service key out of the environment: probe degraded, alert fired, cause named. Alerts fall back to execution logs when no webhook is set - a lost alert is worse than no alert.

nguyen-minh.dev - personal portfolio & graphics lab · WebGPU · Three.js/TSL · Next.js 16 · Canvas 2D

- Diagnosed a textbook Framer Motion optimisation (LazyMotion) as a net regression on this app - measured +8 KB gzip on first load - then reverted it and documented the trade-off rather than shipping a change that looked right and measured wrong.
- Built a GPU-resident particle system where 3,072 trails - 245,760 vertices - are simulated entirely in WebGPU compute shaders across three per-frame passes, so no vertex position ever crosses the CPU boundary during the render loop.
- Instrumented every render engine on the site - react-three-fiber, imperative RAF loops and a Matter.js runner - behind one pause/resume contract driven by intersection and tab-visibility state, so no GPU work happens off-screen or in a backgrounded tab.

EDUCATION

Master's - Expert in Software Development (EU level 7) | Strasbourg Ynov Campus, France

Sept 2024 - Oct 2026

- 2-year work-study Master's, ranked #5 in France for Web Development (Eduniversal 2025). Assessed on four blocks by an external professional jury: framing a project (stakeholder mapping, feasibility, risk register, workload and cost estimation, architecture), building it (CI/CD, prototyping, unit tests, security, accessibility, acceptance testing), leading it (planning, indicators, trade-offs) and keeping it running (monitoring, incident logging, release notes).

B.Sc. Computer Science / Web Development (BUT MMI, 180 ECTS) | University of Strasbourg

Sept 2021 - Sept 2024

- Specialised in front-end development, UI/UX and interactive systems; final 2 years in apprenticeship at BDR Thermea.
